

### MCU 1.1V regulator

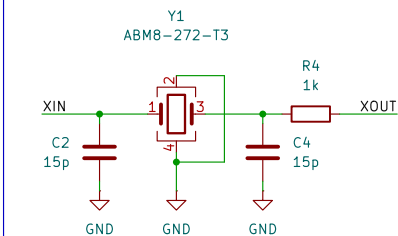

TODO: NEEDS CHECKING

### Boot and reset buttons

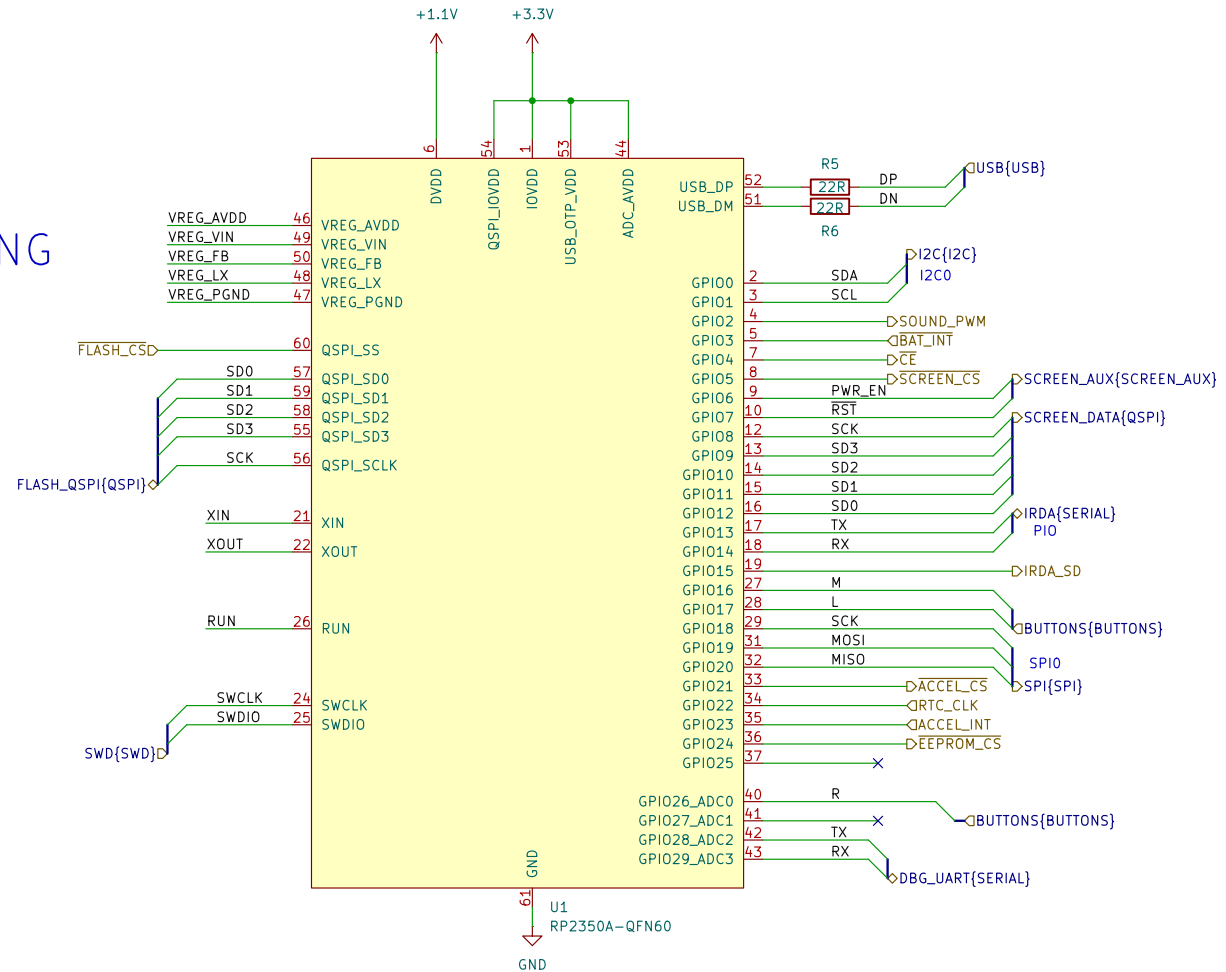

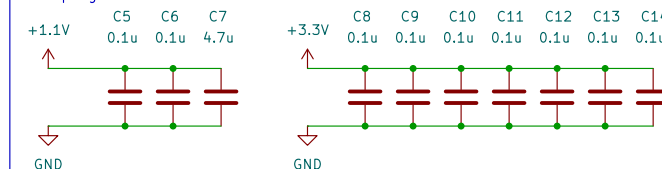

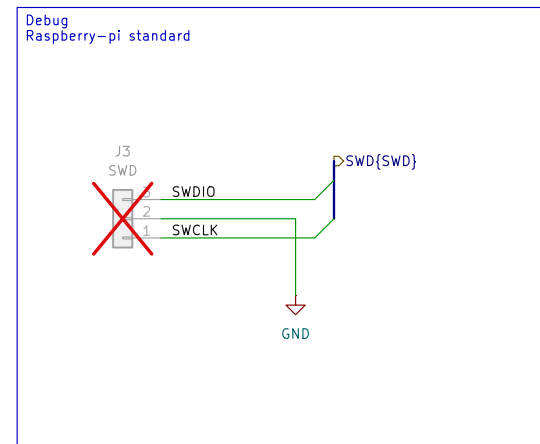

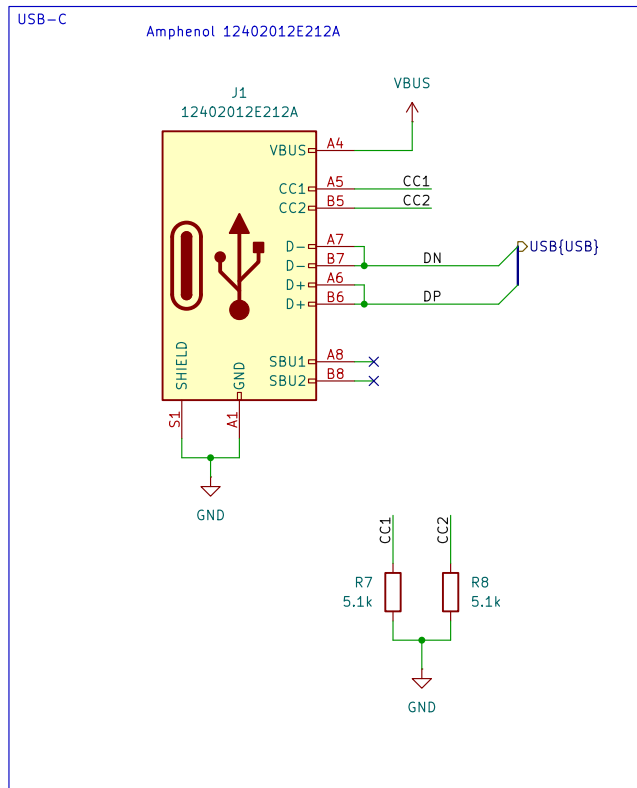

### 12MHz Crystal

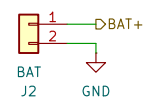

Ensure ground plane is >1.0 mm from surface

### Decoupling and bulk

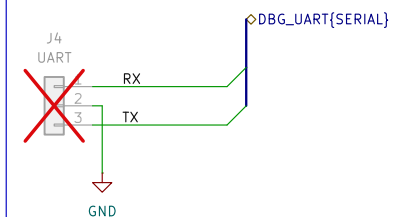

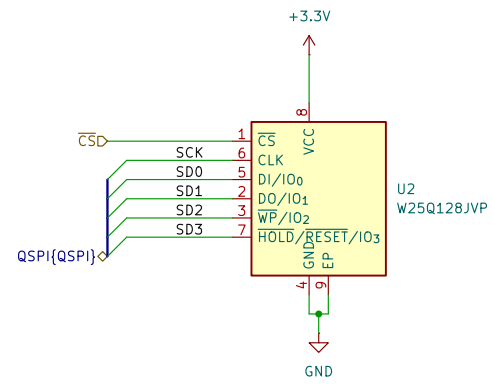

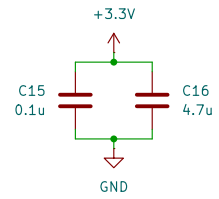

Battery connector  
Molex 53261-0271  
Mates with:  
- 151340200 cable assembly  
- 510210200 connector

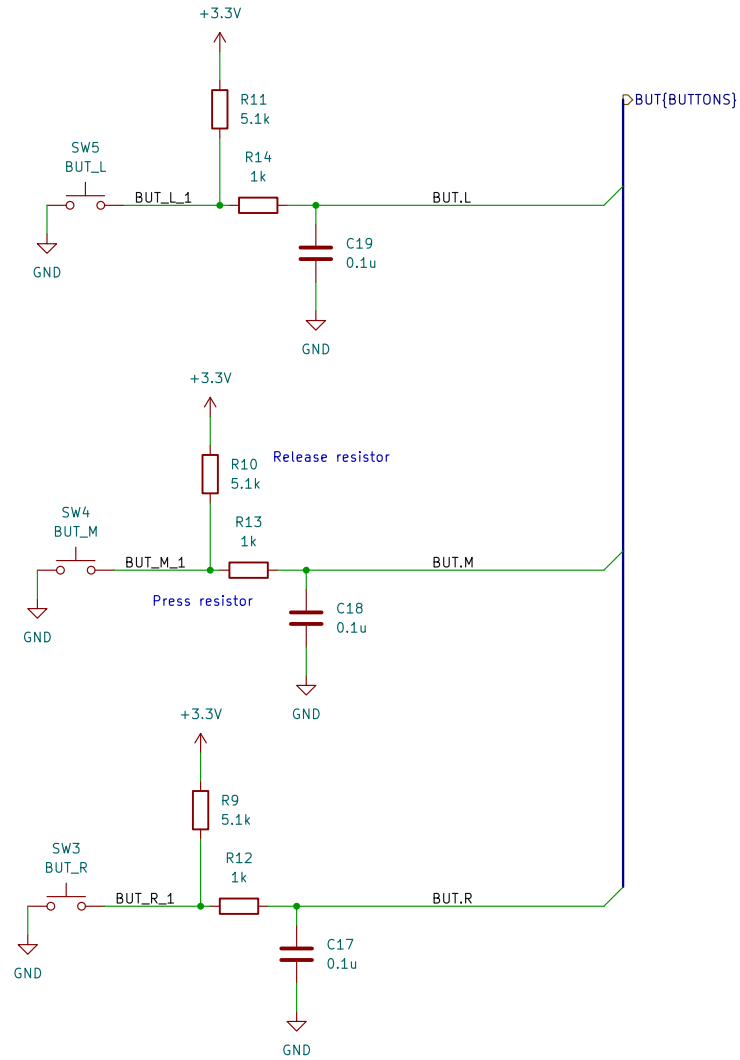

Debug UART  
Raspberry pi standard

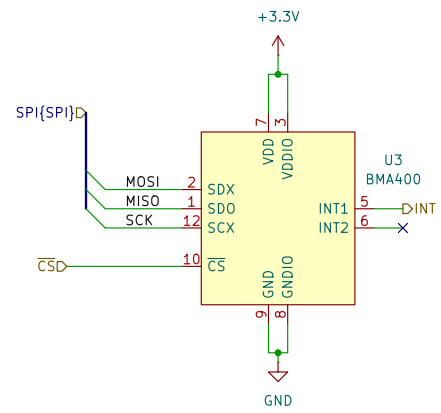

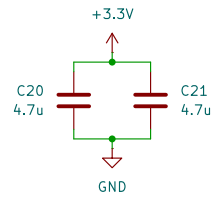

Decoupling and bulk

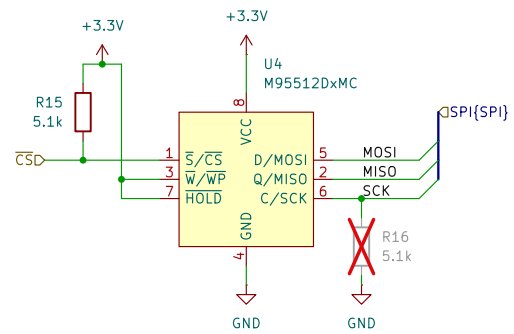

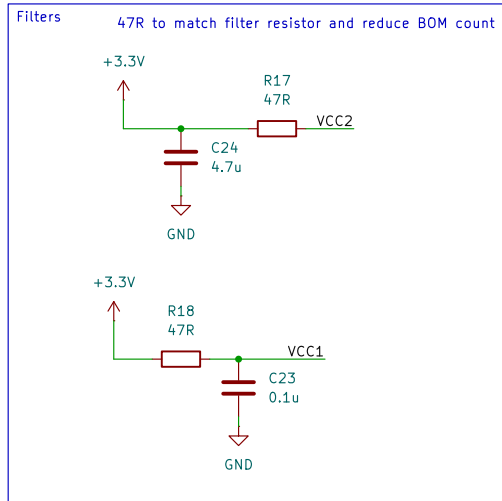

# Decoupling and bulk

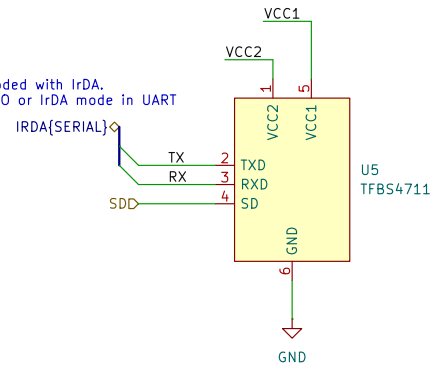

# Decoupling and bulk

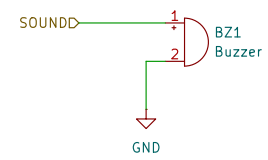

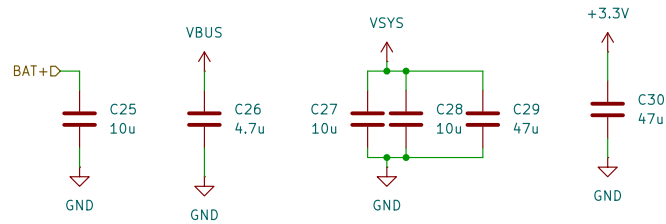

VCC2 average transmit current max 85 mA  
 Peak current 430 mA.  
 Min resistor value at 1/16 W average dissipation = 8.7 - 10 Ohms

Expect serial to be encoded with IrDA.  
 MCU can do this with PIO or IrDA mode in UART

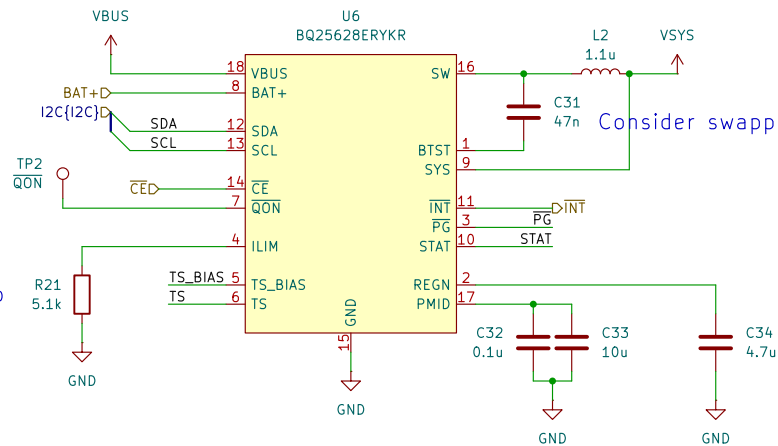

### Decoupling, smoothing and bulk

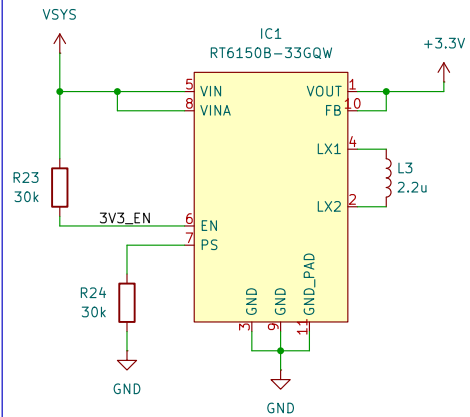

### PMIC battery charger with power path

Datasheet recommends:  
 $CVBUS > 1\mu$   
 $CPMID > 10\mu$   
 $CSYS > 20\mu$   
 $CBAT > 10\mu$

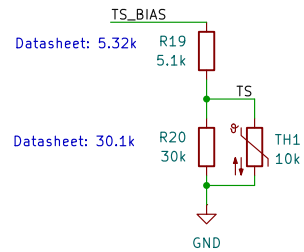

$L\_ILIM = K\_ILIM / R\_ILIM$   
 $K\_ILIM = 2500 \pm 250$   
 $5.1k = 490 \text{ mA}$

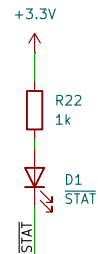

### 3.3V switching regulator Basically taken from pico 2 datasheet/schematic

### Thermistor

### Indicator LEDs

### Unused outputs

## Decoupling and bulk

The diagram illustrates two decoupling capacitors, C35 and C36, connected to a power supply and ground. C35 is a 10uF capacitor connected to VSYS and GND. C36 is a 4.7uF capacitor connected to +3.3V and GND.
